

smartAlpha™

Condition Monitoring for Mining Applications

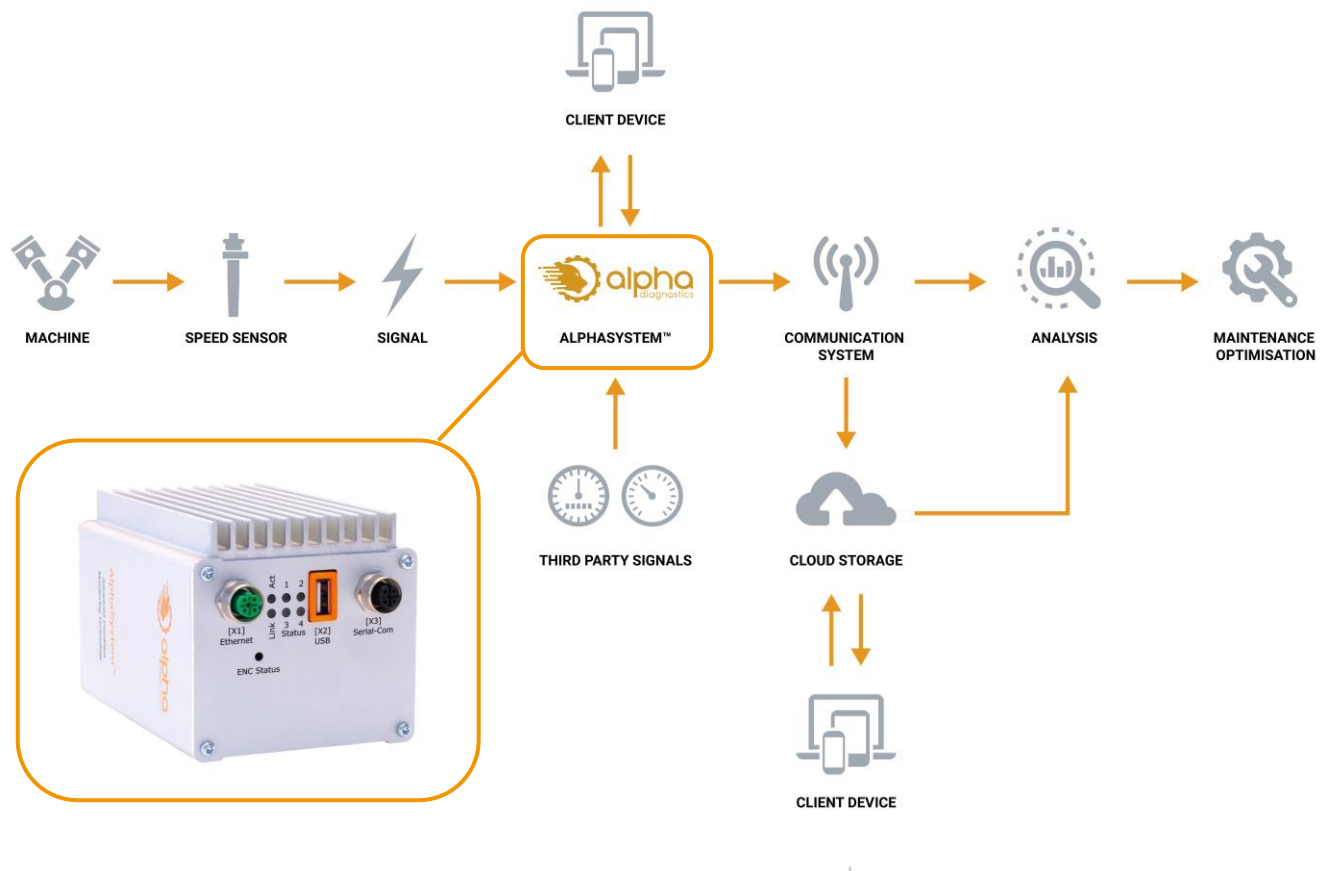

Keep mining equipment on the move with a diagnostic solution for engines, traction motors and other equipment

alphadiagnostics.ch

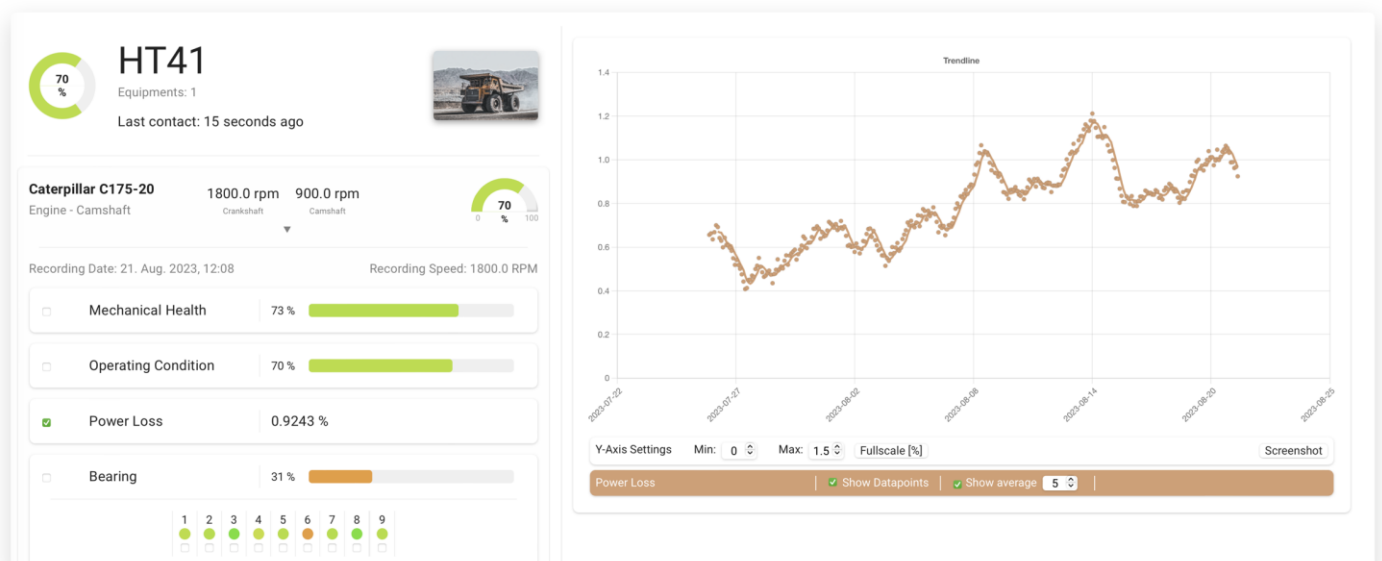

System Architecture

Based on the analysis of instantaneous speed of the machine, smartAlpha™ is a plug and play solution which detects anomalies within minutes. Multiple extension modules allow the integration of additional condition data to form a powerful monitoring platform.

The alphaCloud™ dashboard allows users to easily visualize the diagnostic data collected by smartAlpha™ devices:

Diesel Engine & Generator Monitoring

smartAlpha™ is non-intrusive and easy to retrofit. Existing speed sensor signals can often be used.

Engine diagnostic features

- Engine health indicators are provided graphically and/or numerically.
- Overview indicators for mechanical health, operating condition and power loss.
- Cylinder-specific indicators for compression, injection and bearing issues.
- Requires only 2 speed sensor signals per engine.
- Works with 2-stroke and 4-stroke engines of all manufacturers and with all fuel types.
- Easy integration into existing IoT environments.

Further applications

Due to its modular architecture, monitoring the condition of diesel engines is not the only function smartAlpha™ provides - it also allows crews to monitor other sub-systems and components:

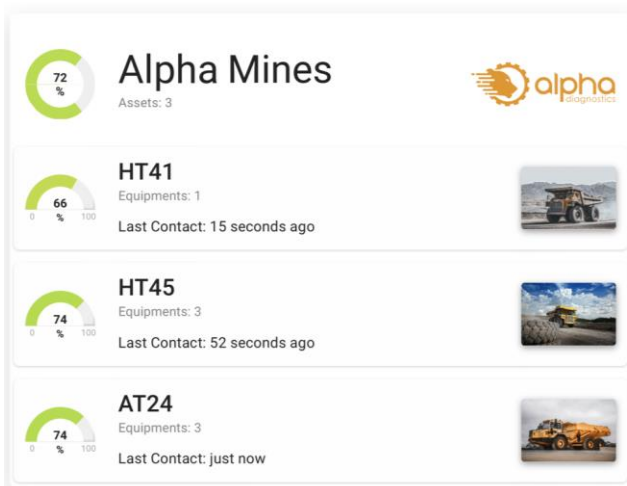

- Traction motors
- Generators
- Gearboxes
- Pumps
- Batteries

Please contact us for more information on these features.

Fleet-wide Trend Analysis

Monitoring the condition of an entire fleet offers the advantage of being able to compare performance and condition data from multiple vehicles and analyse trends.

AlphaSystem™ can easily interface with a variety of IoT platforms for data collection and visualisation. As condition indicators are generated locally on the vehicle, results can be easily transferred via limited bandwidth networks.

Business Benefits

- Early detection of impending failures
- Avoidance of unnecessary shutdowns
- Quick ROI and reduced energy cost
- Easy retrofit on all vessels
- Significant savings due to targeted maintenance
- Extended and optimised propulsion system lifetime
- Support for predictive and condition based maintenance strategies.
